

Who we are :

We are a complete solution partnership, established between the experienced professionals (power, oil and gas executives) and a world-wide large shipping organization (Mitsui O.S.K. Lines – MOL) that includes LNG (liquefied natural gas) carrying vessels and FSRU vessels (floating storage regasification unit)

Partnership for gas :

We are able to bring LNG (at large quantities) by means of our own LNG carriers and make it stored in our own mobile LNG storage unit and then transformed into natural gas in the same mobile unit and pump it into a gas distribution system or to any gas using industrial facility and/or power plant. This solution can be conceived for immediate natural gas supply while constructing a new LNG terminal too.

Partnership for power :

We are able to convert a heavy fuel oil or any liquid fuel using power plants into a clean natural gas using power plants or construct new natural gas using power plants with highest efficiency and create an environmentally clean and price-wise efficient solution that avoids costly and polluting fuel oil usage for electricity generation

Partnership for complete solution :

We can combine both above solutions and provide an off-shore electricity generation by adding a powership alongside the FSRU vessel and generate electricity by connecting the step-up transformers (on the ship) to the national or regional electricity grid and add a (mid-to-large capacity) to the country's electricity generating capacity without any need to invest into new power plant that may take long time to construct and put into service. This solution can be conceived for immediate electricity generation while constructing a new power plant too.
